

A seminar announcement

SUBJECT:

TIME–FREQUENCY ANALYSIS IN STRUCTURAL DYNAMICS

by Pol D. Spanos.

L. B. Ryon Endowed Chair in Engg.

Rice University, Houston, Texas, USA

When : 11:00am–noon, May 24 (Monday)

Where: CEE Seminar Room(3207), 3rd Floor,
(Bldg W1–2)

ABSTRACT

- Traditional Fourier analysis has been an important tool in engineering applications for many years. However, it does not capture readily non-stationary and local features, which are inherently present in many structural dynamics problems. The seminar will focus on modern time-frequency analysis techniques for capturing localized effects and evolutionary frequency content by using wavelets, chirplets, and signal intrinsic modes. These techniques will be presented in context with earthquake engineering applications and they will be used for analyzing both historic ground accelerograms and linear/nonlinear seismic responses of benchmark structures. However, they are applicable as well to a plethora of other structural engineering, and civil engineering in general, themes.
